

Case Study - Hames Partnership Ltd

Hames Partnership Ltd

Overview

Hames Partnership Ltd is a local management accountant firm and wishes to consolidate its computer resources and also improve the transfer of information across its company.

The organisation consists of the head office and Off-site workers who consist of staff who work from home.

Previously the company had struggled with passing live company information such as updated address lists, new appointments via calendar, accounts files and quotations to its home based workers, also the home based workers could not access company information.

The company was considering an in house Exchange Server to solve these issues, however after evaluating the costs of purchasing hardware, installing and maintaining the server software in house it was deemed too expensive to implement, plus the business wanted to keep to its core competencies. However, the company still wanted the benefits of this technology.

The Solution

ServeLogic Plc designed a solution for Hames Partnership which consisted of Hosted Exchange Services, and VPN connectivity through to our network. This allowed Hames Partnership access to all of the features and functionality they looked for from an in house server expert without the price tag and without the administrative head-aches associated with running IT server solutions in-house. Best of all, the complete solution was up and running within 2 days.

The Return On Investment

ServeLogic's solution was based on its hosted services architecture, so there was minimal upfront costs. Result: the return on investment was almost instant.

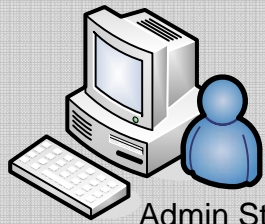

Hostlogic created a Hosted Exchange solution that was perfect for our business
