

# Case Study – Searchlogic Plc

## Searchlogic Plc

### Overview

Searchlogic Plc operates a Microsoft Exchange Server and Microsoft CRM via two in house servers. These Servers are accessed by staff situated at their head Office and field sales and engineering staff situated in the UK and India. The company was seeking to increase server uptimes whilst off-loading the costs and staffing over-head associated with in-house server management, whilst still having full access to their servers.

### The Solution

ServeLogic Plc designed a managed hosting solution for Searchlogic, by moving their servers over to one of Hostlogic's secure data-centres. A ServeLogic technical solution specialists project managed the solution from initial concept through to completion and final hand-over to our technical support staff.

Searchlogic's servers were moved 'out of business hours' in order negate any downtime, and ServeLogic's mail queuing servers held any incoming mail whilst the equipment was being moved. Once the equipment was installed and tested, the queuing servers released any mail back to the customer's Exchange server.

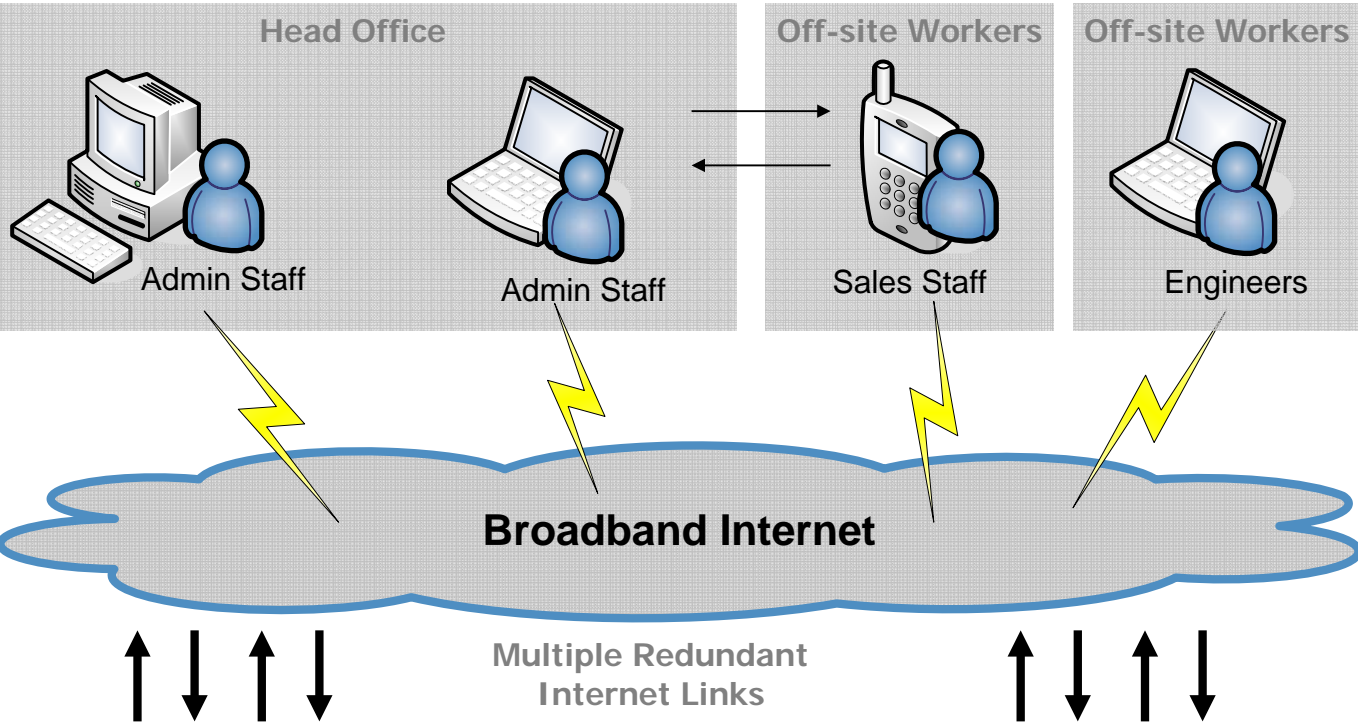

Prior to the solution installation, our technical staff conducted a complete survey on the customer equipment, identifying any security and configuration Changes required prior to the move.

The customer's servers are now monitored and maintained 24x7x365 dramatically increasing server up-time and performance.

**"Out-sourcing our server management to Hostlogic reduced our costs and increased our reliability"**  
 Simon Cleaver - Searchlogic Plc

### The Return On Investment

Searchlogic was able to instantly remove their server management costs and benefited from increased security, up-time, and performance.

ServeLogic 3 Layer Enterprise Network Protection System

Front Line Defense – Attack Protection

Second Line Defense – Attack Detection / Mitigation

Third Line Defense – Authentication / VPN
